

# Anti-PC and Authenticity Performances in Politics in Brazil and the United States

## Abstract

Various politicians have denounced “political correctness” (PC) in discourse. While some scholars argue that anti-PC discourses are populist tools to label elites (Mudde 2004) or a form of cultural backlash against liberal changes (Norris and Inglehart 2019), these explanations focus on specific manifestations of anti-PC by specific politicians that embody their arguments. Instead, this article argues that anti-PC discourses are performances of authenticity in politics. As authenticity performances, anti-PC discourses reduce the perceived link between thinking and saying for audiences [conway2009]. A framework for identifying several discursive performances of authenticity in politics, beyond anti-PC, that focuses on displays (what), projections (who, when, and where), and mechanisms (how) is developed. A purpose-built dictionary of terms is designed to detect these authenticity performances in large text datasets of campaign remarks, debates, interviews, and official speeches gathered for presidents and presidential candidates at the national level in Brazil and the United States since the 1980s. The analysis indicates that the total frequencies of authenticity performances are not systematically greater in election years, politicians usually perform one or more authenticities above the 95th percentile when they are candidates or after having left office. However, in the case of Brazil, there authenticity performances spiked in politics from 2010 to 2016, the Dilma Rousseff years. Moreover, the variation in types of authenticity performed in time and across cases indicate that contextual conditions make some types of performances more, or less, credible to audiences at junctures so politicians adapt to perform authenticities audiences “want to hear”. Lastly, debates became the setting in which authenticity is performed most frequently, while interviews are the setting in which authenticity is performed least frequently, in both cases in recent years.

# 1 Introduction

In the second sentence of his inaugural speech as president of Brazil, Jair Bolsonaro declared the day in which the people began to be freed from political correctness<sup>1</sup>. Bolsonaro is not unique in this sense, other politicians as Trump, Chavez, Morales, Berlusconi, Bush, Sanders, and Lula, have openly denounced political correctness (PC) and/or publicly employed politically incorrect language<sup>2</sup>. Broad audiences appear to respond positively to these statements in multicultural countries, such as the United States (US) and Brazil, where large portions of the population fall under racial, ethnic, and other categories PC language attempts to safeguard<sup>3</sup>. Populist scholars argue that contemporary populist’s profit from breaking with PC language and use PC to identify modern elites (Mudde 2004)<sup>4</sup>. Cultural backlash scholars argue that anti-PC discourses speak to resentment caused by silent liberal changes (Norris and Inglehart 2019). However, both populism and cultural backlash focus on specific manifestations of these discourses by specific leaders that embody their arguments, leaving aside any systematic or empirical analysis of language usage or patterns across contexts. *How, then, anti-PC discourses appear and change over time in politics?*

This paper argues that anti-PC discourses in politics are discursive performances of authenticity. Performances are the projections of a situation when one appears before others to attempt and project a definition of the situation (Goffman 1956). Perceived authenticity, as a character trait that conveys ones’ convictions, is connected to higher levels of political trust from electorates (Stiers et al. 2021; Valgarosson et al. 2021) and essential to a candidate’s political success (Alexander 2010; Fordahl 2018). As an authenticity performance, anti-PC language reduces the perceived link between thinking and saying to audiences (Conway III et al. 2009; Conway, Repke, and Houck 2017). Still, anti-PC is not the only authenticity performance in politics. This article then develops a framework to identify various types of authenticity performances in political discourses. The framework focuses on the performative display (what), projection (who, when, and where), and mechanisms (how). Authenticity performances are divided into two types, individual and collective. Individual authenticity performances derive plausibility from audiences’ expectations about a political performer, these performances include claims of truth, lie accusations, taking responsibility, or pointing fingers at other politicians. Collective authenticity performances derive plausibility from shared cultural knowledge between politicians and audiences, these include pointing at origins, allusions to common sense, anti-PC discourses, or assertions of territorial knowledge.

Political discourses at the national level in Brazil and the US since the 1980s are gathered and explored to assess variations across time, by politicians, and in different settings. The 1980s were chosen as they mark the beginning of the university debates surrounding PC language in the US, and the decade in which democracy was re-established in Brazil. Texts for campaign remarks, debates, interviews, and official speeches for presidents and presidential candidates in Brazil and the US are scraped to construct the datasets. A purpose-built dictionary of terms is created to capture various authenticity performances in discourses. The analysis indicates that the total frequencies of authenticity performances are not systematically greater in

<sup>1</sup>Find the whole speech here. Besides denouncing PC, Bolsonaro has also frequently referred to indigenous peoples and LGBT community in politically incorrect ways.

<sup>2</sup>PC is used as an abbreviation for political correctness and politically correct. Trump denounces PC and employs politically incorrect language across several domains ranging from immigration to race and indigenous people. Trump’s ‘war’ on PC is frequently brought up in campaign rallies and on Twitter. Morales displays ‘bad manners’, favors plain speaking and is not PC often making sexist and homophobic comments. When it comes to Hugo Chavez, the leader making public sexual comments during his talk show aired on national television, towards George W. Bush, among many others controversial remarks. Berlusconi has numerous times made references to Barack Obama’s skin color in incorrect ways, made similar comments about some football players, and made several sexist and homophobic public remarks. Lula quickly recalled the national guide on PC language as he constantly used several of the expressions listed in his speeches and campaign rallies. Bush, while president, famously denounced PC language on campuses during a commencement speech. Bernie Sanders stated several times how important PC was for Trump’s campaign and PC had gone too far.

<sup>3</sup>Most Americans appear unsupportive of PC language with estimations that range from 52% of the population (Montanaro 2018) to 80% of the population disliking PC (Mounk 2018). This change in percentages derives from the variety of questions that are asked. For example, one poll asked if participants thought that PC was a big issue in the US, while another asked if they favored the process of the country becoming more politically correct. For Brazil, a recent national poll asked participants whether they agreed that the ‘PC patrol is making the world too boring’; 56% of participants agreed completely or partially with the statement (Goncalves and Goncalves 2020).

<sup>4</sup>To discuss whether, or the extent which, Bolsonaro and Trump are populists is not the objective of this paper, though there are many excellent discussions on this topic (see Tamaki and Fuks 2020; Hawkins and Rovira Kaltwasser 2018).

election years. Most politicians perform authenticities above the 95th percentile when they are candidates, before being elected a first time, or after having left office. However, in the case of Brazil, we see a spike in the frequency authenticity is performed in politics from 2010 to 2016, the Dilma Rousseff years. Women in politics, arguably, need to personally justify themselves and their public policy choices more frequently than the man in the sample. Moreover, the variation in types of authenticity performed in time and across cases indicate that contextual conditions make some types of performances more, or less, credible to audiences at certain junctures. In such, politicians adapt to perform authenticities audiences “want to hear”. Indeed, many authenticity performances appear in high frequencies for opposing, and associated, candidates in similar years. Finally, debates became the setting in which authenticities are performed most across cases, while interviews are the setting in which authenticity was performed least frequently, in both cases in recent years. Social media platforms give candidates diverse outlets to interact with audiences bypassing journalists in interviews, whereas debates are large-scale media events that produce “sticky” political bites charged with imagery that circulate more than ever in democracies.

## 2 From PC and Anti-PC to Populism and Backlash

### 2.1 PC and anti-PC overview and effects

Definitions of PC range from an “idealistic intervention” to “liberal fascism” (Hughes 2011; Feldstein 1997). In practice, PC language avoids judgmental terms, preferring euphemistic substitution and presupposes that lexicon changes mediate discrimination in positive ways (Hughes 2011, 13) <sup>5</sup>. Anti-PC discourses, instead, represent a *dismissal of PC substitutions and/or the denouncing of PC language and users*. However, to understand what anti-PC language entails, we must first briefly overview PC’s history and effects. The modern conception of ‘political correctness’ originated in Mao Tsé-Tung’s depiction of the ‘correct socialist party line in the 1930s, used to describe “doing the right things” and “thinking the right thoughts” (Hughes 2011). The term was picked up by leftist circles in the US during the 1960s and used to describe more orthodox followers of socialism or as a critique of excessive orthodoxy (Feldstein 1997; Weigel 2016; Hughes 2011). It was not until the 1980s that right-leaning conservative elites in the US, including many academics, started denouncing PC language substitutions as a left leaning strategy that restricted freedoms of speech (Feldstein 1997; Weigel 2016). These conservative elites were able to swiftly recycle the meaning of PC by keeping some of its’ original meaning, but disconnecting it from historical context, and conflating it with enemy building narratives and imagery (Feldstein 1997).

The university debates in the 1980s and 1990s brought wide attention to PC, multiculturalism, and affirmative action in the US (Berman 2011). d’Souza (1991), for example, discussed the apparent duplicity between a liberal educational system and multicultural claims, arguing that PC further victimizes minorities on campuses and undermines their merits with affirmative action policies that could potentially generate more racist backlash. As a response, Gutmann and Habermas highlighted how misplaced PC debates politicized and polarized important societal dialogues (Gutmann 1994). Yet, most multiculturalism scholars at the time dealt with PC as a matter of public or party disagreement and lamented their popularity with certain communities while leaving unaddressed the nature of PC language, the relation between the speaker’s identity to the information provided, and why diverse communities related or contested these semantic changes (Loury 1994). The university debates helped disseminate and connect matters of PC, affirmative action policies, and multiculturalism to left leaning (progressive) political ideologies and anti-PC to right-wing (conservative) ideologies across the world (Feldstein 1997; Bush 1995). By the mid-1990s, PC debates in the US had become as much about rhetorical strategies to forward ideological political agendas as about the diverse cultural movements’ efforts to re-label (Feldstein 1997; HALL 1994).

The spreading of issues covered by PC language and the complex political forces supporting it, and opposing, required that the cultural and individual effects of PC in society be theorized. HALL (1994), for example,

describes the ambiguous truth and contested cultural authority of the PC phenomenon to argue that individuals may disapprove PC language because these are relatively new demands for cultural transformation. Similarly, Fairclough (2003) (p. 24) argues that PC is a socially constructed cultural and political label for which effects depend on the resistance of structure and practices. Even though euphemistic substitutions are not a modern manifestation, as changing orthodoxies under moral imperatives exist since the invention of printing, PC language has exponentially expanded the number of substitutions (Hughes 2011). This expansion of PC language generates more abstract and imprecise replacements that can feel unnatural and create confusion, patronize subjects, and further socioeconomic inequalities via linguistic processes (Hughes 2011). This contributed to the evolution of PC from a noun used to describe language substitution to an adjective used to describe excess politeness or evasion of truths in society or for individuals (Weigel 2016; Chait 2015).

## 2.2 Anti-PC and populism(s)

In *The Populist Zeitgeist*, on the rise of populist parties in liberal democracies, Mudde (2004) (p. 543) defines populism as a thin centered “ideology that considers society to be ultimately separated into two homogeneous and antagonistic groups, ‘the pure people’ versus the ‘corrupt elite’, and which argues that politics should be an expression of the *volonté générale* (general will) of the people”. There are three mentions of PC in the article. They discuss how contemporary populists profit from breaking with politically correct language, because citizens’ increased emancipation made issues surrounding PC more widespread, alongside how PC has been used to identify a modern elite (Mudde 2004, 594 - 602). Since then, populists have routinely been associated with anti-PC discourses. Still, Mudde’s analysis leaves undertheorized which elites are characterized as PC by various populist leaders with a variety of ideological commitments. This is puzzling since many political, economic, and intellectual elites are often the drivers of anti-PC discourses in societies. Moreover, for Mudde (2004) Mudde (2007), populism is not a standalone ideology <sup>6</sup>. This makes it hard to pinpoint if anti-PC discourses are a portion or manifestation of the populist thin ideology, an adjacent ideology, or a contextual feature of a specific society. Besides, the account leaves unclear when, and why, anti-PC discourses are a politically profitable strategy for populists but not for other political actors. In such, there appears to be a leap associating populism with anti-PC discourses without systematically or empirically analyzing its usage in time and patterns across contexts. Other influential theories of populism do not mention anti-PC discourses (see Weyland 2001; Laclau 2005; Hawkins 2009) and, when mentioned, anti-PC discourses fulfill a peripheral role to help identify exclusionary right-wing populist parties in Europe (Betz 2001).

Recent efforts to rethink populism as a political performance or a repertoire, rather than a (thin)ideology, focus on patterns of communication in populism. For instance, Moffitt and Tormey (2014) (p. 387) argue that we must rethink populism as “the repertoires of performance that are used to create political relations”. More specifically, we must think about how populists perform the people, threats, breakdowns and crisis, and bad manners (Moffitt and Tormey 2014; Moffitt 2016). Concerning bad manners, the authors argue that “much of populists’ appeal comes from their disregard for ‘appropriate’ ways of acting in the political realm” (Moffitt and Tormey 2014, 392). Bad manners often performed with swearing, slang words, and political incorrectness (Moffitt and Tormey (2014), p. 392]. Performing these repertoires helps politicians appear as an “outsider” against the “establishment” (Moffitt and Tormey 2014; Moffitt 2016). Likewise, arguing against a minimal and pure definition of populism, Brubaker (2020) (p. 60) contends that populism is a discourse and stylistic repertoire that includes ‘a communicational style that claims to favor plain-speaking, common sense and authenticity against intellectualism and political correctness’. Anti-PC discourses then became a portion of a broad populist communication style or repertoire; though favoring plain speaking, displaying bad manners, or being anti-PC, are not exclusive to populists or connected to populist discourses by ideology <sup>7</sup>.

<sup>6</sup>See Aslanidis (2016) for a good discussion on whether populism is an ideology.

<sup>7</sup>Brubaker (2017) Brubaker (2020) view of anti-PC discourses is not inconsistent with Mudde (2004) Mudde (2007) point about PC and elites. Rather it implies that certain intellectual elites might be tagged as PC, not any elite, and this is connected to anti-intellectualism. This is also consistent with Hughes (2011) argument about PC language expansion that leaves some people feeling patronized and confused by PC language.

## 2.3 Anti-PC Backlash

At the intersection between populism, authoritarianism, and multiculturalism, *Cultural Backlash* argues that authoritarian populists appeal to more conservative portions of the electorate who feel ignored seeing their societies shift towards post-materialism (Norris and Inglehart 2019). These factors, alongside economic fluctuations and immigration flows, allow leaders to exploit generational gaps by voicing cultural backlash and enacting reactionary policies (Norris and Inglehart 2019, 446). There are eight mentions of PC in the book. On anti-PC, the authors argue that social conservative individuals with authoritarian orientations react to some trends with feelings of resentment for the erosion of respect for their core values and that “is the essence of the backlash against ‘political correctness’, in which sexist language, anti-foreigner sentiments, or the expression of racist attitudes are condemned by the liberal consensus and silenced in mainstream political debate” (Norris and Inglehart 2019, 123). Rather than developing further the mechanisms of how anti-PC discourses work, deliberate on which types of anti-PC discourses connect to resentment, or exemplify what is meant by anti-PC discourses, the authors take for granted that anti-PC discourses are connected to resentment, and that is why they resonate with “old, rural, or uneducated” electorates <sup>8</sup>. Nevertheless, anti-PC discourses appear to resonate more broadly within societies for various reasons, many unrelated to resentment (e.g. humor) <sup>9</sup>. How Bolsonaro, for example, employs anti-PC in quick, direct, and short comments that focus on culturally salient themes without being necessarily internally coherent is, arguably, more decisive to his following than the content itself Carlo and Kamradt (2018). Or how Trump is characterized as ‘not PC’, as a positive character trait, appears more decisive to voters than his recognizable flaws or the negative meanings associated to what he is indeed saying <sup>10</sup>. While both the cultural backlash and populism accounts of anti-PC in politics have merits, they focus on a few specific manifestations of these discourses by specific leaders that embody their respective arguments. Consequently, these literatures only partially explain what anti-PC discourses are, how they function, or why they matter for political outcomes.

## 3 Theory

### 3.1 Performance, authenticity, and anti-PC in politics

Performances are the projections of a situation when one appears before others, “however passive their role may seem to be, will themselves effectively project a definition of the situation by virtue of their response to the individual” (Goffman 1956, 3). But why should we understand discursive politics through performance or, rather, why do politicians say the things they do? Conventionally, there are two broad types of answers to this question. On the one hand, politicians might say the things they do according to what is more profitable to them (i.e. rational choice). On the other hand, politicians might say the things they do because of their beliefs (i.e. ideology). Though, neither may hold in practice as politicians can, at different times, say what is more profitable, say what they believe in, or say things without intentionally thinking about it. Usually, whether a politician is saying what they believe in, or what is more profitable, depends on the audiences’ interpretations. Alternatively, understanding politics through performance offers a more flexible answer to why politicians say the things they do, that is, to project their understandings. Performance allows to theorize that audience’s interpretation hinges on factors beyond discursive content or meaning, such as how things are said. Seeing politics through performance provides more realistic assumptions to theorizing how politicians “do politics” (see Van Dijk et al. 1997). Understanding politics through performance focus less on causality and interpretation of message meaning in discourse and more on identifying discursive patterns and functioning.

---

<sup>8</sup>Norris and Inglehart (2019) appear to ‘passively’ pass on the blame to ‘old, rural, and uneducate’ voters for ‘undesirable’ political outcomes with broad causal explanations extrapolated from thin linear correlations that illustrate little of these complex relationships. Others, as Mishra (2017), rely on a misplaced engagement with history that focus on a few instances that exemplify arguments as if these were the rule.

<sup>9</sup>There are countless examples of PC and anti-PC language being explored humoristic ways for entertainment as, for example, notoriously, TV shows as ‘South Park’, ‘The Office’, and ‘It’s Always Sunny in Philadelphia’.

<sup>10</sup>Bill Maher, a journalist and comedian who was the host of a television series called Politically Incorrect in the 1990s, contends that ‘when you talk to Trump supporters, they’re not blind to his myriad flaws, but they always say he is not politically correct’.

Still, getting to audience’s perception and discursive elements beyond text is challenging. There are, however, several capturable discursive displays connected to the how, the where, and when of political performances that allows to identify patterns and variation in political performances. A good performer or performance, for example, is successful in projecting a view of a situation or context and connecting with audience, both of which can be connected to authenticity perceptions. Additionally, performance emphasizes the performer’s role, the script, the stage, and the audience, rather than only the meanings associated with the content of a political discourse. There are also important implications of thinking discursive politics through performances. Performance places agency both with audiences, watching and evaluating politicians “doing” politics, and with political performers. This means script changes can be theorized to be intentional individual innovations or unintentional chattering by performers, while political accomplishments reflect positive evaluations from audiences. This does not mean factors such as social media, economic crisis, and cultural changes, among other factors, are irrelevant. Instead, these become political themes to be explored in politics and provide context for audiences’ interpretation.

Authenticity has long been discursively performed in politics with, for example, self-references to origins, remarkable stories, allusions to civic tradition, and displays of ‘vulgarism’ (Fordahl 2018, 309; Alexander 2010). Authenticity is an individualistic performance that aims at radiating truthiness outward (Taylor 1992; Fordahl 2018). Authenticity in politics does not concern being truthful to oneself but appearing coherent with individual or societal values to audiences (Valgarosson et al. 2021; Fordahl 2018). Stiers et al. (2021) refer to authenticity in politics as an essential character trait that conveys candidates’ convictions and that has positively affected electoral preferences across several European democracies. As a political tool, authenticity helps build political trust for candidate by demonstrating to electorates that politicians are in touch with ordinary people and their struggles (Valgarosson et al. 2021). Authenticity perceptions were, for example, essential for Obama’s success in 2008 (Alexander 2010) and, arguably, defined the 2016 American election in Trump’s favor (Fordahl 2018). Authenticity, in politics, is an unstable and malleable label that requires social validation; it demands contortion, modification, and active individual effort (Fordahl 2018). Therefore, authenticity, as a political performance, not always culminate in consistency, but appearing real to one’s inner self to many in audiences.

In social psychology, PC language is understood as a communication norm that attempts to remove negative language by means of self and group censorship (Conway III et al. 2009; Conway, Repke, and Houck 2017). This communication norm is shown to backfire due to contamination of individual information processes by authority or legitimacy effects (Conway III et al. 2009; Conway, Repke, and Houck 2017). Authority effects surrounding PC language occur when language is believed to be insincere if it is commanded by an authority (Conway III et al. 2009). Legitimacy effects are caused by individuals’ own self-censorship, which leads to increased awareness that language interactions may not be genuine (Conway III et al. 2009). Building on these findings, Rosenblum, Schroeder, and Gino (2020) uses several survey experiments to illustrate how politically incorrect language makes political communicators appear more authentic, to have stronger convictions, and to be less strategic, in comparison to PC politicians. In fact, the denouncing of a “PC politician” or a “PC ideology” engrains an allusion to inauthenticity, to someone or something that expresses its views in calculated ways to avoid judgment (Hughes 2011; Weigel 2016). Anti-PC discourses are connected to authenticity in politics by reducing the perceived link between thinking and saying for audiences (Conway, Repke, and Houck 2017)<sup>11</sup>. Hence, anti-PC performances signals to audiences’ precisely that politicians might be authentic to inner self. Though, as alluded above, anti-PC is one authenticity performance and authenticity in politics can be performed in politics in a variety of ways.

## 3.2 Authenticity performances

Valgarosson et al. (2021) argue that there are three broad types of authenticities, historic, categorical, and value: value authenticity (i.e. the authentic politician) being the most pertinent in politics. Stiers et al.

<sup>11</sup>The argument also considers the insights of **bad manners** as a repertoire (Moffitt 2016; Moffitt and Tormey 2014) of **plain speaking** as communication style (Brubaker 2017, 2017) in populism. Though the conceptualization here is broader and intends to theorize anti-PC outside of populism, it is somewhat consistent with how these theorists understand what these repertoires/styles are, how they work in politics, and why they matter.

(2021) connect authenticity in politics to a sense of “realness” that, in recent times, has repeatedly turned to anti-politics to connect politicians to ordinary people. But how authenticity as this abstract attributed individual trait or group perception, with huge political implications, come about in politics? Looking at authenticity in politics, as a performance, requires we identify displays, projections, and mechanisms. Display refers to detecting certain performance (what) and is constrained by projection and mechanism. Projection relates to the level at which it is convincing that performance is authentic. Projection encapsulates the role (who), the setting (where), and the structure (when) for certain display(s). The role relates to the part performer takes in politics. Roles can generate different expectations and ranges of possibilities for authenticity performances (e.g. candidates versus elected officials). Setting refers to where a performance takes place (e.g. debate or official speech). Structure indicates the timing in which performance is inserted (e.g. before/after an election). Mechanisms refer to the theorized pathways (how) by which a projected display might work to produce authenticity. Diverse answers to each of these performative aspects generate different expectations about authenticity performances in politics.

Although what can be an authenticity performance, and not, is not always straight or capturable discursively, there are several indications of how authenticity has been performed in politics. Alexander (2010), for example, discusses how allusions to origins, territory, and traditions were employed by Obama to connect with audiences and generate a sense of authenticity. These performances focus on the cultural connections shared by politicians and audiences and can be essential to legitimize a candidate’s knowledge about the “real” issues a country face. Fordahl (2018) argues that Trump’s authenticity built upon iconic, often vulgar, representations of civic life and objective reality as a “straight shooter deal maker”. Allusions to family values and his business experience were central to Trump’s performances. These noticeable types of performances in discursive politics become, then, displays of authenticity performance. Displays for authenticity performances can be divided in two broad types in political discourses: individual and collective. The types refer to the mechanism that might give plausibility to a certain performance. Individual authenticity performances derive plausibility for performance based on audiences’ expectations about a political performer (or opponent) considering the information they have. These performances include stating to be telling the truth or claiming others are lying and taking responsibility for actions or pointing fingers at other’s errors. Collective authenticity performances are more elaborate displays of authenticity that derive plausibility for performance based on the cultural connections shared between audiences and performer. These performances include anti-PC, pointing at origins, allusions to common sense, or claims of territorial knowledge <sup>12</sup>. Table 1, below, summarizes each authenticity performance theorized, their respective displays, and mechanisms.

<sup>12</sup>Politically incorrect expressions coded were selected from a 1992 dictionary of politically correct language, this assumes that most of these terms have for long been agreed upon as not PC (Beard and Cerf 1993).

Authenticity Perfor- mance	Displays	Mechanism
<b>Truth Telling</b>	Mentions truthiness, sincerity, and honesty when describing oneself. Examples: 'the truth is', 'this is the truth', 'am not lying', 'is/are/am honest', 'honesty', 'is/are/am sincere', 'is/are true'	Speaker appears to be telling the truth regarding beliefs or facts.
<b>Lying Accusing</b>	Mentions dishonesty, untruthfulness, and insincerity when used to describe others. Examples: 'not the truth', 'not true', 'untruthful', 'is/are lying', 'is/are liars', 'is/are dishonest', 'is/are fake', 'is/are a hypocrite'	Speaker appears more sincere vis-a-vis others.
<b>Consistency</b>	Mentions career consistency, responsibility, accountability for individual. Examples: 'I/we delivered', 'check and see', 'keep my word', 'kept my word', 'keep promises', 'I am/we are responsible', 'I/we take responsibility', 'I/we guarantee'	Speaker appears consistent regarding pledges.
<b>Finger Pointing</b>	Mentions lack of accountability, inconsistency and/or blame others for mistakes. Examples: 'are/is inconsistent', 'are/is irresponsible', 'their fault', 'not my fault', 'they left us with', 'are/is responsible', 'costed us', 'false/fake/broken promises'	Speaker appears accountable for actions.
<b>Origins</b>	Alludes to birthplace, origins, and roots to describe background, values, and tell their story. Examples: 'I was born in', 'I come from', 'I/we grew up in', 'my family', 'I was raised', 'my background', 'I was thought', 'my hometown/community/city'	Speaker seems culturally connected to the country.
<b>Common Sense</b>	Alludes to common sense, reason, and logic to describe choices or preferences. Examples: 'is/are common sense', 'everyone/everybody knows', 'it is undeniable', 'stating the obvious', 'everyone agrees', 'we all know', 'no one disagrees that', 'we have all learned that'	Speaker seems to make choices consistent with what others in society would.
<b>Territory</b>	Alludes to sub-portions of the territory known and/or visited. Examples: 'have seen in', 'have been to', 'I/we/have visited', 'came all the way to', 'came/came back from', 'saw/see first-hand in', 'I/we were hosted', 'my/our time in'	Speaker seems territorially connected to sub-regions, nation, or territory.
<b>Anti-PC</b>	Alludes to PC language negatively, employs politically incorrect language, or claims to speak what one thinks without filters. Examples: 'not politically correct', 'political correctness', 'speak/speaking my mind', 'say/saying what everyone thinks', 'non-white/colored/oriental/fat/handicapped people'	Speaker seems to be saying what thinks on culturally contested themes.

## 4 Methodology

### 4.1 Case selection

In Brazil, restrictions to freedoms of speech regarding racism, criminalized in the constitution of 1988, and affirmative action policies in universities, put in place since the late 1990s, were widely discussed albeit a long history of direct and indirect political opposition to these (see Freitas and Castro 2004; 2013). However, neither constitutional nor affirmative action debates sparked much discussion about PC. In effect, the PC terminology was translated from outside the Brazil (see Possenti 1995) and it did not directly appear in public-political debates until 2004, when the Secretariat of Human Rights of the President published a manual of PC language which contained 96 popular expressions deemed incorrect for being racist, sexist, or homophobic (Fiorin 2008; Morato and Bentes 2017). At that time, the federal government quickly recalled the publication due to criticism (Ibid.). Since the mid-2000s humoristic interpretations of politically incorrect language and politically charged calls against a PC country started to appear frequently in the media (Morato and Bentes 2017; Weinmann and Calau 2014). Alongside this, several articles in popular periodicals such as magazines and newspapers, as well as some influential books, have been written opposing PC language ever since (Weinmann and Calau 2014). By the 2010s, PC in Brazil started to be referred to as a “controversy” and, nowadays, PC in Brazil is a widely contested phenomenon in society and politics.

Nonetheless, Brazil and the US held the two largest slave populations in the world until slavery was abolished in each country respectively. Similarly, these two countries became large settler states for diverse groups of migrants in the following centuries. These historical processes rendered their current populations heterogeneous in terms of demographic composition and cultural heritage. Such makes PC language’s appearance and influence in these societies understandable, but the eminence of anti-PC discourses in national politics is somewhat puzzling as electorates are likely to encompass several large groups PC language safeguards. While Brazil and the US are relatively similar in geographical and population sizes, they are dissimilar in many other ways as levels of economic development, culture and, in some ways, their political systems. Thus, each case is understood as configuration, formed by the aggregation of parts that make sense in the context of the case (Ragin 1987). This allows us to consider similarities and differences across time and space and broadly compare them in many aspects, including political discourses.

### 4.2 Data

Text data on official speeches, campaign rallies, debates, and interviews for elected presidents and runoff candidates were gathered since 1980 for the US and 1985 for Brazil. The 1980s marked the beginning of the university debates surrounding PC in the US. In Brazil, democracy came back in 1985, though direct presidential elections were held in 1989. All the text for the US were scrapped from (The American Presidency Project)[<https://www.presidency.ucsb.edu>] (TAPP) repository. Conversely, collecting data for Brazil proved more difficult due to availability. For official speeches, Cezar (2020) dataset on official speeches for Brazilian presidents from 1985 to 2019 was updated to include the missing speeches from 2019 to 2021 using the (Brazilian Presidential Library)[<http://www.biblioteca.presidencia.gov.br/sobre-a-biblioteca/biblioteca-da-presidencia-da-republica>]. Text for debates, interviews, and campaign rallies were scrapped from subtitles automatically generated for YouTube videos. The number of videos available for later election cycles, after the 2000s, is considerably larger than earlier ones. As well, some election cycles in Brazil were shorter than others as national elections were decided on the first round, therefore, data for those cycles is more limited. For those reasons, and due to the longer time scope, the number of observations in the text datasets for the US is greater than for Brazil <sup>13</sup>.

The comparison of data for different settings in which politics gets done provide more complete picture of how discursive politics change, and not, in each of these settings, across time, or by politicians. Table 2, below, summarizes the number of text observations by setting in each case, the earliest date, the latest

date, and the sources. For interviews, those occurring in the period between two years before elections and one year after the election (or tenure for elected) were compiled. For debates, data on runoff debates in the case of Brazil and debates after party candidates were nominated in the case of the US were gathered<sup>14</sup>. Campaign remarks occurring on election years for runner-up candidates were gathered. Therefore, the datasets for campaign and debates have their latest date as the last election year in each case, that is 2018 for Brazil and 2020 for the US.

### 4.3 Operationalization

After collection, the data was cleaned by standardizing variables across datasets and removing punctuations and accents to facilitate comparison. The texts were aggregated by politician and year. Authenticity performance, including anti-PC discourses, were identified via a purpose-built dictionary of terms that codes the discursive displays associated with each performance (see Appendix 1)<sup>15</sup>. The dictionary of terms was developed listening to samples of randomly selected speeches, campaign remarks, interviews, and debates from the datasets. The dictionary has similar definitions in Portuguese and English in relation to the words and expressions searched. The number of words included in the dictionary for each performance is similar across languages. The dictionary was designed to reduce the possibility of overlap, even as some authenticity performances might share similar displays. Directionality in the text is important to identify authenticity performances, specially to distinct when speakers talk about themselves or others, thus, no stop words were removed from the text datasets. That is, the dictionary of terms includes combinations of pronouns/determiners and verbs/nouns to avoid false-positive matches. All frequencies of authenticities performances are normalized for the number of characters in each text. Normalization helps account for discrepancies in the number of observations for the two cases and in time for the same case.

## 5 Analysis

### 5.1 Authenticity Performances in Time in Brazil and the US

On average, allusion to origins and mentions of truth telling are the two most regularly performed authenticities in Brazil and the US. Table 3, below, displays the average values for each authenticity performance by country represent, the values were normalized by the number of characters in texts. For both cases, the US and Brazil, origins and truth-telling are the two most performed authenticities on average. While origins are a collective authenticity performance (i.e. based on the cultural connections shared between audiences and performer), truth-telling is an individual authenticity performance (i.e. based on audiences' expectations

<sup>14</sup>Those are debates after party nominations in the US and runoff debates for Brazil. There are a few exceptions to this in Brazil for elections decided in the first round (e.g. 1994) or elections where candidates were unable to participate in runoff debates (e.g. 2018). In these cases, the participations of the two most voted candidates in the first-round debates were gathered. The number of debates for both Brazil and the US in Table 2 reflect the number of politicians coded for each runoff debate in dataset. That is, the text of each debate was separated by politicians.

<sup>15</sup>See also Kentikelenis and Voeten (2021) for a good example of a purpose-built dictionary in a bag of words approach to text analysis.

about a political performer or performance). Yet, as authenticity performances, claiming to be telling the true, or being truthful, and allusions to origins promote oneself instead of focusing on others. Indeed, authenticity performance that focus on others, such as lie-accusations and finger-pointing, are performed relatively infrequently on average in both cases. Consistency, an inward-looking individual authenticity performance, also appears relatively frequently in both cases. In the case of the US, specifically, territory and anti-PC are moderately performed on average. In the case of Brazil, common sense is performed, on average, relatively frequently. Unsurprisingly, politicians appear to speak mostly about themselves when doing politics.

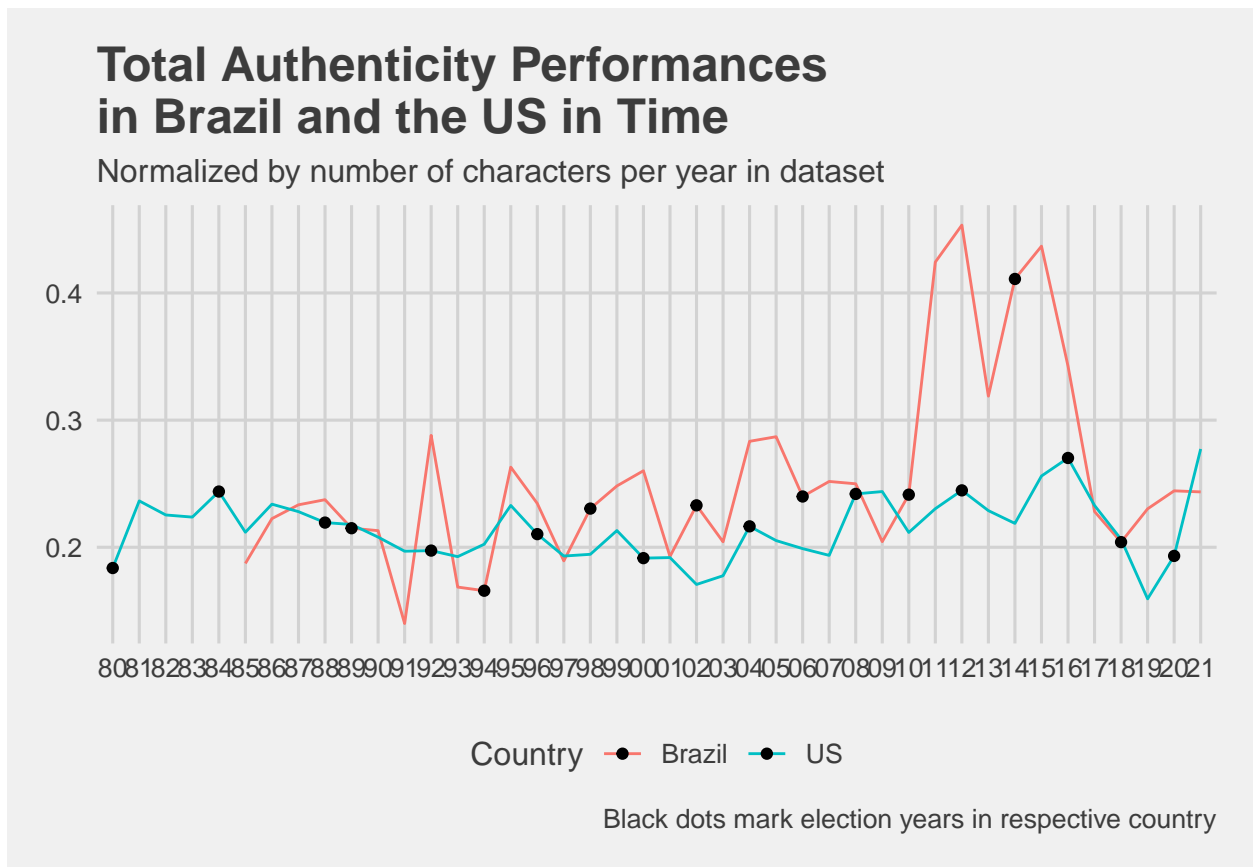

Authenticity performances are not monolithic in time. How, then, do their frequencies change in time? Figure 1, below, illustrates the total frequencies for authenticity performances in Brazil and the US in time. In the figure, the x-axis represents the years and the y-axis represents the sum of all normalized authenticity performances for that year. For each case, the black dots represent election years. Remarkably, the figure appears to show no systematic increases in the total frequency scores associated to election years in Brazil and the US in time <sup>16</sup>. This is puzzling considering that appearing authentic to electorates is shown to influence election outcomes (Fordahl 2018; Stiers et al. 2021; Valgarosson et al. 2021). These findings might indicate that elected politicians have more freedom to perform authenticity, or discuss less relevant policy matters, in non-election years. As well, incumbents can be more careful towards when, where, and how authenticity is performed around election years.

In the case of Brazil, we also see a large increase in frequencies of authenticities performed between 2010 and 2016, the Dilma Rousseff years <sup>17</sup>. This could indicate that there is a relationship between gender and the frequencies in which authenticity is performed in politics. While there only two women politicians in the data (Rousseff and Hillary Clinton), and this makes challenging to extrapolate about how gender and authenticity performances correlate, there is a vast literature that investigate differences communication styles by gender in politics (Wood 1994; Christine Banwart and McKinney 2005; Blankenship and Robson 1995; Franceschet, Piscopo, and Thomas 2016). Rousseff, arguably, needed to justify herself and her public policies with further concrete reasoning and perform certain authenticities to connect with audiences more frequently than the man in the sample. Nevertheless, authenticity has generally been performed with greater

<sup>16</sup>A linear regression that correlates election years, as factors, to the total of authenticity performances for each case has also been run. The coefficients show that for both cases the relationship between election years and the frequency of authenticity performances is slightly negative (i.e. elections year correlate with a decrease in the total of authenticity performances). This relationship is negative and statistically significant for the case of the US.

<sup>17</sup>A linear regression correlating the total of authenticity performances to years, as factors, in Brazil confirms statistically significant increases for the years of 2012 and 2015, non-election years and when Rousseff was president.

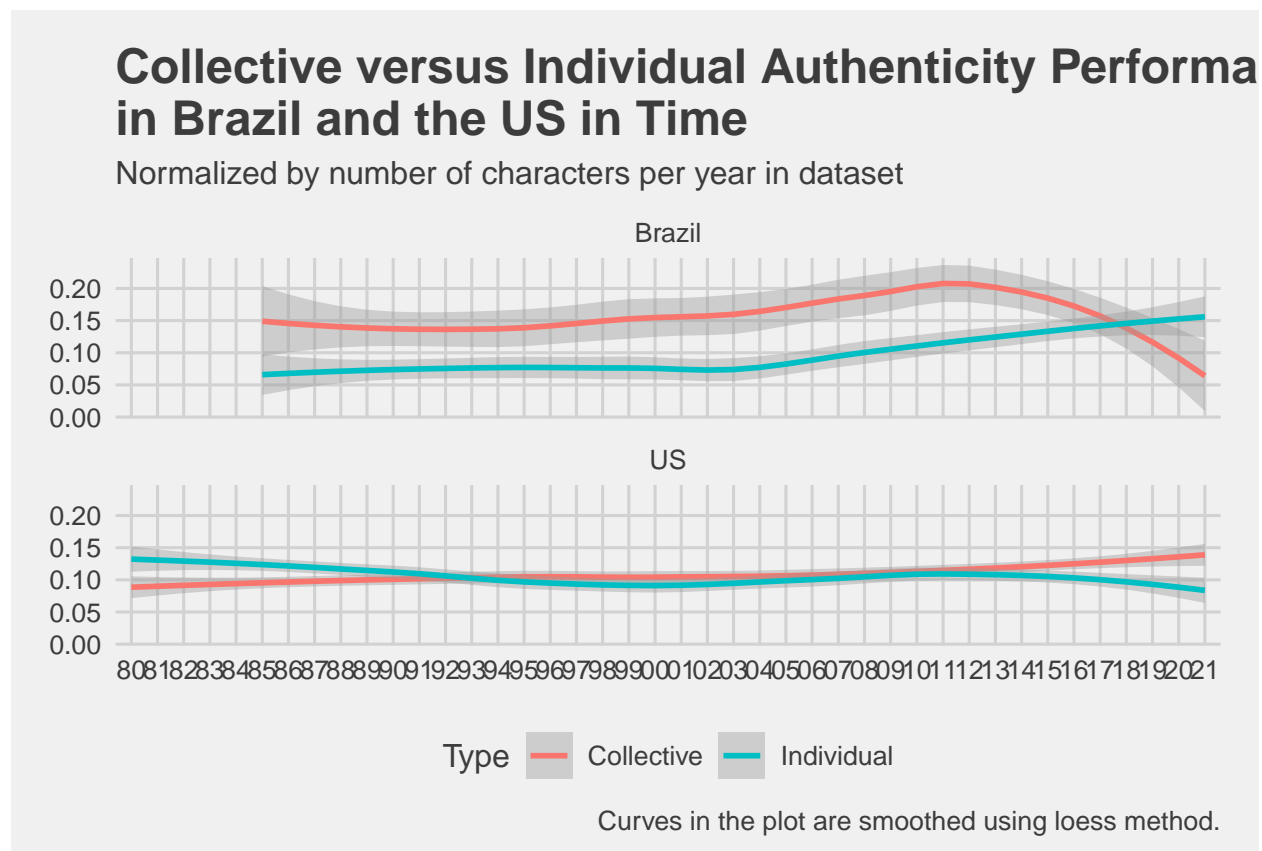

Figure 1: Total Authenticity Performances in Time in Brazil and the US

frequency in politics in Brazil since the mid-1990s in comparison to the US, which could be related to the differences in the number of parties in the political system. Brazil has many parties and, thus, politicians are less susceptible to broad party pressure to conform and represent heterogeneous interests of groups within in comparison the US with two major parties.

Though, how do the types of authenticity performed in politics change in time? Figure 2, below, illustrates how collective and individual authenticity performances change in time for Brazil and the US. In the figure, the x-axis represents the years and the y-axis represents the sum individual and collective authenticity performances for that year. In Brazil, collective authenticity performances were performed much more frequently than individual performances from the 1980s until the early-2010s. This trend begins to change at that point and, by 2019, we see a reversal of this pattern, whereas individual authenticity performance surpasses collective performances. Conversely, in the case of the US, individual authenticity performances were performed more frequently from through the 1980s. Though, from the early-1990s until the early-2010s, both performances appear at very similar rates. This pattern changes in the mid-2010s with collective authenticity performances surpassing individual.

Figure 2: Collective versus Individual Authenticity Performances in Time in Brazil and the US

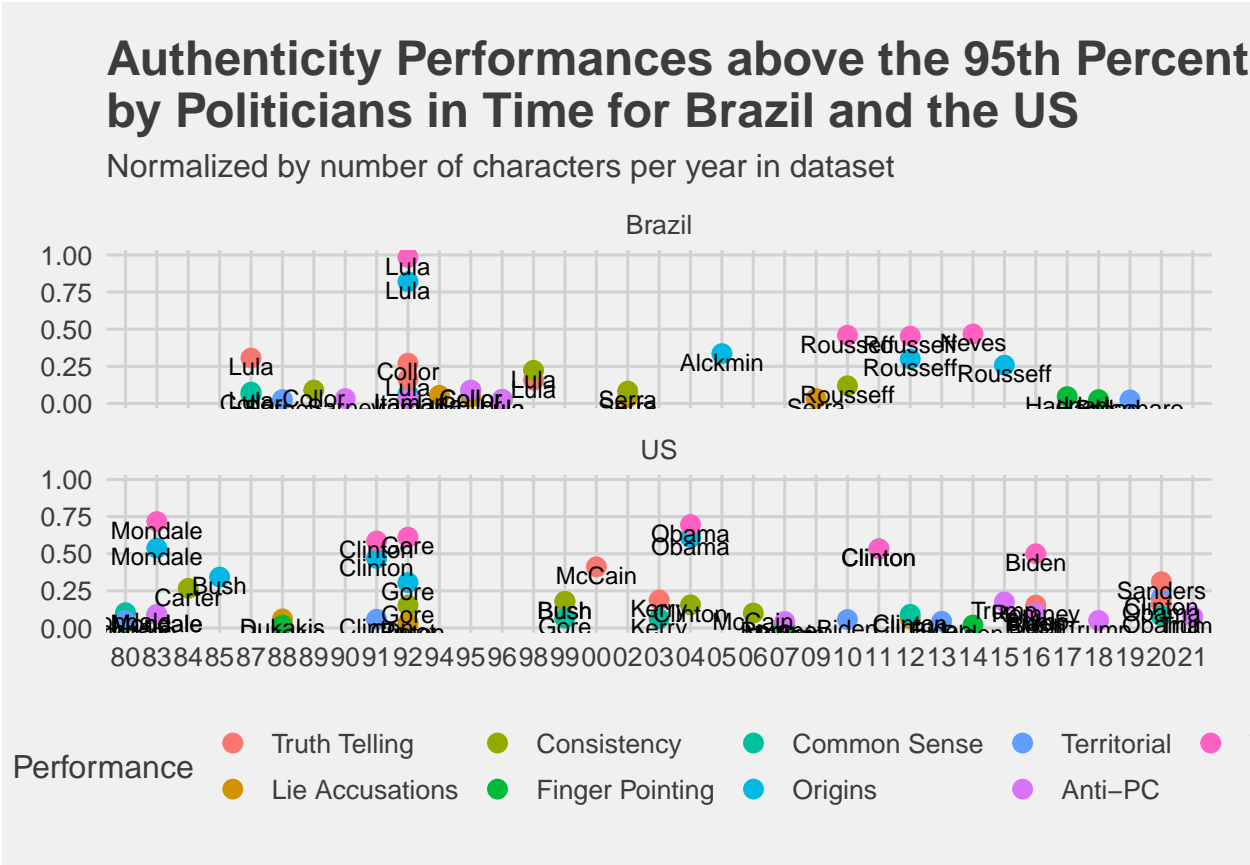

These diverse patterns are related to contextual conditions that make some types of performances more, or less, credible to audiences in each case in time. Audiences in Brazil likely became tired of collective authenticity performances that focus on share cultural links with the politico-economic crisis of the mid-2010s and, in turn, became more interested in simpler individual performances that are credible based on expectations for political performers. Whereas, in the US, audiences likely grew tired of performances that were balanced and focus on both collective and individual authenticities equally around the early-2010s in favor performers and performances that focus further on established cultural connections. Interestingly, in both cases, these patterns begin to change before recent election years (e.g. 2016 for the US and 2018 for Brazil) and continue after, even as politicians at the top might have changed. This indicates that timing

could favor certain candidates who already perform certain authenticities, but also that politicians perform authenticities that audiences want to hear (i.e. are more credible at certain juncture).

### Authenticity Performances by Politicians in Brazil and the US

Distinct presidents and presidential candidates might focus on some authenticity performances over others. Figure 3, below, captures authenticity performances by presidents and presidential candidates that fall above the 95th percentile for Brazil and the US at a certain year. In the figure, the x-axis represents the years and the points represents a politician that performed one, or more, authenticity above the 95th percentile at that year. The 95th percentiles are calculated for each authenticity performance and for the total of authenticity performances. While some politicians and years appear multiple times, other candidates and years do not appear at all. Most politicians in Brazil and the US perform one, or more, authenticity above the 95th percentile when they were candidates, before being elected the first time (e.g. Lula), or after having left office (e.g. Clinton). This further indicates that politicians running for re-election perform authenticity less around election years. Other politicians do not perform any authenticity at the 95th percentile for any year campaigning or in office (e.g. Reagan and Cardoso). This could indicate that these politicians perform authenticity less than others or, at least, that they do not focus on one authenticity more than other politicians at any point in time.

Figure 3: 95th Percentile Authenticity Performances by Politicians in Brazil and the US

When it comes to the total of authenticity performances, Mondale, Clinton, Gore, Obama, and H. Clinton perform the total of authenticity performances above the 95th percentile certain year in the case of the US, but none of these politicians were in the oval office when they did so. In the case of Brazil, Lula, Collor, Neves, and Rousseff performed the total of authenticities above the 95th percentile for a certain year. Rousseff is the only politician in the whole sample to perform the total of authenticities above the 95th

percentile while in office. Interestingly, Wood (1994) (p. 137-148) argues that women’s speech style in politics include personal disclosures of details, using of anecdotes, and concrete reasoning, which are consistent with common sense and origins performances that were performed above the 95th percentile by Rousseff during her years in office. The fact that Dilma performs various authenticities the 95th percentile while in office further indicates not only women in politics have a distinct style, but also that they likely feel the need perform authenticity at a higher rate to connect to audiences and justify policy choices more than their male counterparts.

When it comes to specific performances, truth telling was performed above the 95th percentile by politicians as Kerry and McCain around the year 2000, and by Obama and Sanders around the year 2020. Consistency was performed above the 95th percentile by several candidates across time, most notably Carter, W. Bush, and Clinton; and common sense was performed above the 95th percentile by Clinton, W. Bush, and Obama after they left office. In the case of anti-PC, Mondale in the 1980s and Trump in the mid-2010s perform anti-PC. Though these politicians belonged to different parties and had diverse political stands, both often employ “telling like it is” communication style <sup>18</sup>. Comparably, for Brazil, truth telling, origins, and territory were performed above the 95th percentile by Lula and Collor in through the 1990s. In fact, Lula and Collor performed more authenticities above the 95th percentile than all other politicians during this period. When it comes to anti-PC, Sarney, Franco, and Collor stand out for Brazil in the early-1990s. Bolsonaro only performs territorial authenticity above the 95th percentile in 2019. Particularly, the plot seems to indicate that similar authenticity performances above the 95th percentile, occur for associated and opposing politicians in similar years. This could be due to politicians responding to each other on specific authenticity performances, imitating each other at a certain election cycle, or connected to a contextual condition that make certain authenticity performance more credible around certain time.

### 5.3 Authenticity Performances across settings in Brazil and the US

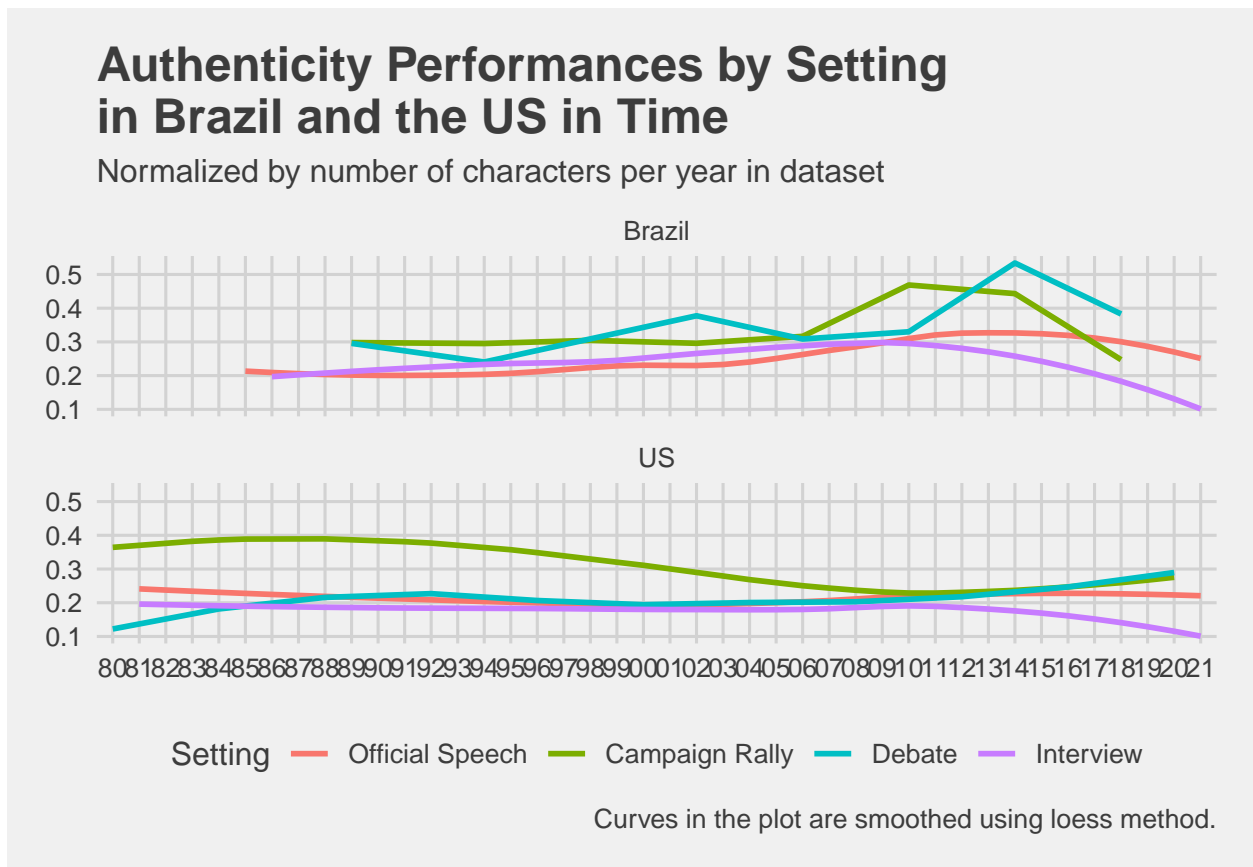

The frequency of authenticity performances can also change across settings in which politics gets done <sup>19</sup>. Figure 4, below, illustrates authenticity performances in Brazil and the US in time and across setting. The x-axis represents the years and the y-axis represents the sum of all normalized authenticity performances for each setting per year. The plot shows that, in the US, authenticity was performed much more frequently in campaign rallies than in other settings until mid-2000s. At that point, the frequency in which authenticity was performed across all settings in the US becomes more similar until the early-2010s. In the case of Brazil, we see a different trend. The frequency in which authenticity is performed in campaign rallies generally increased from the late 1980s to the mid-2010s. In fact, consistent with the findings above, there is a sharp increase in the frequency in which authenticity is performed across campaign rallies, debates, and in official speeches around the Rousseff years. We also see a sharp decrease in the frequency in which authenticity is performed across all setting from the mid-2010s onwards in Brazil.

In Brazil and the US, authenticity has been performed less frequently on interviews, in comparison to other settings, from the early-2010s onwards. This could be related to the spread of social media whereas candidates have diverse outlets to interact with audiences, bypassing journalists, while performing authenticity to a wide variety of people. Moreover, in both cases, debates become a setting in which the frequency of authenticity performances generally increased in time. In fact, debates go from being the setting in which authenticity was least performed in the US in the early-1980s to become the setting in which it performed most by the late-2010s. As well, the frequency in which authenticity is performed in debates generally increased in Brazil

<sup>18</sup>For more on Mondale’s “truth” telling style see his (1984)[<https://www.nytimes.com/1984/07/20/us/transcript-of-mondale-address-accepting-party-nomination.html>] Democratic Convention acceptance speech. Some of Mondale’s mentions of truth telling regarding raising taxes, for example, is similar to numerous accounts of Trump’s denouncing PC in terms of wasting peoples time by not “telling how it is” what they might “not” want to hear.

<sup>19</sup>The relationship between the average frequencies of authenticity performances per year and setting was also investigated employing fixed-effects linear panel models. Fixed-effects models account for time effects while controlling for unobserved associations within the model variables (Allison 2009). In the regression (see appendix 2), the correlation between the frequencies of authenticity performances and campaign settings for the US, in comparison to official speeches (reference category), is positive and highly statistically significant. Interviews also appear to correlate positively with authenticity performances in the US, in comparison to official speeches. In the case of Brazil, both campaign and debate settings correlate positively with authenticity performances in relation to official speeches. However, using this approach, we miss how these correlations change in time.

Figure 4: Authenticity Performances by Setting Time in Brazil and the US

in time, becoming the setting in which authenticity is most performed in the late-2010s. In both cases, debates are events televised to millions of voters. Debates give candidates the opportunity to discursively confront one another and attempt to convince undecided voters, though why and the extent to which they might matter for election outcomes is debatable (see McKinney and Warner 2013). In terms of authenticity performances, debates’ format requires candidates to answer quick and, as large-scale media events, become sources of “sticky” sound, text, and video bites charged with imagery, rather than meaning, that circulate to mark and represent political cycles in democracies (Foley 2012,; Coleman 2000). As political bites become shorter, but more widespread, debates become ever important settings for a wide variety of performances.

## Conclusion

This article investigates how anti-PC discourses work in politics and how these types of discourses have changed over time. A brief review of the populism and cultural backlash scholarship illustrates how these literatures focus on specific manifestations of anti-PC discourses by specific leaders. Instead, this paper argues that anti-PC discourses in politics are authenticity performances that reduce the perceived link between thinking and saying for audiences (see Conway et al. 2009). Several other authenticity performances are also theorized. Individual authenticity performances, for example, derive plausibility from audiences’ expectations about a political performer (or opponent) considering the information they have. These performances include claims of truth telling or consistency and lie accusations or finger pointing. Collective authenticity performances derive plausibility for performance based on the cultural connections shared between audiences and performer. These performances include anti-PC, pointing at origins, allusions to common sense, or claims of territorial knowledge. A framework for systematically investigating authenticity performances in politics that focuses on performative displays (what), projections (who, when, and where), and mechanisms (how) is established. Large text datasets on official speeches, campaign remarks, debates, and interviews for politicians at the national level for the US and Brazil since the 1980s are assembled by scraping repositories and YouTube. A dictionary of terms for investigating authenticity performances is built based on framework. This allows to identify, compare, and analyze how authenticity performances change in time, by politicians, and across political settings.

The analysis reveals several interesting patterns as, for instance, the total frequency of performances that promote oneself, as origins and truth-telling, is greater than performances that focus on average for both cases. Interestingly, the total frequencies of authenticity performances are not systematically greater in election years in comparison to non-election years. These findings indicate that incumbents might be more careful towards when, where, and how authenticity is performed during election years. Indeed, most politicians perform authenticities above the 95th percentile when they are candidates, before being elected a first time, or after having left office. However, in the case of Brazil, we see a spike in the frequency authenticity is performed in politics from 2010 to 2016, the Dilma Rousseff years. Women in politics, arguably, need to personally justify themselves and their public policy choices more frequently than the man in the sample. Moreover, the variation in types of authenticity performed in time and across cases indicate that contextual conditions make some types of performances more, or less, credible to audiences at certain junctures. In such, politicians adapt to perform authenticities audiences “want to hear”. Indeed, many authenticity performances appear in high frequencies for opposing, and associated, candidates in similar years. Finally, debates became the setting in which authenticities are performed most across cases, while interviews are the setting in which authenticity was performed least frequently, in both cases in recent years. Social media platforms give candidates diverse outlets to interact with audiences bypassing journalists in interviews, whereas debates are large-scale media events that produce “sticky” political bites charged with imagery that circulate more than ever in democracies.

Looking into politics as performance emphasizes the performer’s role, the script, the stage, and the audience, rather than the content, while placing agency both with audiences and performers. Besides, it illuminates several avenues for further research as, for example, the likely relationship between gender and the frequencies and types of authenticity performed in politics. Investigating these gendered aspects of how authenticity is performed in politics can contribute to understanding how gender mediates authenticity perceptions for audiences in politics. Moreover, several influential presidents appear do not perform authenticity as frequent as

candidates who have lost elections to them. Investigating when, how, and for whom, performing authenticity reaps electoral benefits, and not, is pressing to understanding voter's decisions beyond individual political or policy preferences. In brief, thinking politics through performances present new lenses to analyzing how everyday politic are done. Authenticity performances, as a framework, is a less contentious alternative to understand what discourses, as anti-PC, are, how they change over time, and why they might matter for political outcomes.
